

BLUE HOLES

Dive Site:

- Four vertical shafts that open on top of the reef into a large cavern with an exit on the outer reef wall.
- It is common on an outgoing tide to dive through the Blue Holes and continue on to Blue Corner
- The cavern and holes were formed by fresh water erosion millions of years ago, when water levels were much lower then they are today.

Marine Life:

- Tubastrea, Wire & Black coral adorn the Hole walls
- White Tip Reef sharks and Leopard sharks can be seen sleeping on the sandy bottom of the cave, or just outside the exit
- Special critters inside are the Flaming Scallop, Leafy Scorpion fish, Dart fish, Nudibranchs & Cleaner shrimp
- Wahoos, Barracudas, Dog-tooth Tuna, White tips and Grey Reef sharks patrol the exit
